

HIGHLIGHTS OF PRESCRIBING INFORMATION
These highlights do not include all the information needed to use DEFERASIROX TABLETS FOR ORAL SUSPENSION safely and effectively. See full prescribing information for DEFERASIROX TABLETS FOR ORAL SUSPENSION.

DEFERASIROX tablets, for oral suspension
Initial U.S. Approval: 2005

WARNING: RENAL FAILURE, HEPATIC FAILURE, AND GASTROINTESTINAL HEMORRHAGE
See full prescribing information for complete boxed warning.
Deferasirox may cause:
• acute kidney injury, including acute renal failure requiring dialysis and renal tubular toxicity including Fanconi syndrome (5.1)
• hepatic toxicity, including failure (5.2)
• gastrointestinal hemorrhage (5.3)
Deferasirox therapy requires close patient monitoring, including laboratory tests of renal and hepatic function. (5)

----- **RECENT MAJOR CHANGES** -----
Boxed Warning 5/2018
Indications and Usage (1.1) 5/2018
Dosage and Administration (2.1, 2.4, 2.5) 5/2018
Contraindications 5/2018
Warnings and Precautions 5/2018
(5.1, 5.2, 5.5, 5.6, 5.7, 5.8, 5.9, 5.10)

----- **INDICATIONS AND USAGE** -----
Deferasirox tablets for oral suspension are an iron chelator indicated for the treatment of chronic iron overload due to blood transfusions in patients 2 years of age and older. (1.1)
Limitations of Use
Controlled clinical studies of deferasirox in patients with myelodysplastic syndromes (MDS) and chronic iron overload due to blood transfusion have not been performed. (1.3)
The safety and efficacy of deferasirox when administered with other iron chelation therapy have not been established. (1.3)

----- **DOSE AND ADMINISTRATION** -----
Transfusional Iron Overload: Initial dose for patients with estimated glomerular filtration rate (eGFR) greater than 60 mL/min/1.73m² is 20 mg per kg body weight once daily, as oral suspension. Calculate dose to the nearest whole tablet. (2.1)

----- **DOSE FORMS AND STRENGTHS** -----
Tablets for oral suspension: 125 mg, 250 mg, 500 mg (3)
----- **CONTRAINDICATIONS** -----
• Estimated GFR less than 40 mL/min/1.73m². (4)
• Patients with poor performance status. (4)
• Patients with high-risk MDS. (4)
• Patients with advanced malignancies. (4)
• Patients with platelet counts less than 50 x 10⁹/L. (4)
• Known hypersensitivity to deferasirox or any component of deferasirox. (4)

FULL PRESCRIBING INFORMATION
WARNING: RENAL FAILURE, HEPATIC FAILURE, AND GASTROINTESTINAL HEMORRHAGE
Renal Failure
• Deferasirox can cause acute renal failure and death, particularly in patients with comorbidities and those who are in the advanced stages of their hematologic disorders.
• Evaluate baseline renal function prior to starting or increasing deferasirox dosing in all patients. Deferasirox is contraindicated in adult and pediatric patients with eGFR less than 40 mL/min/1.73m². Measure serum creatinine in duplicate before initiating therapy. Monitor renal function at least monthly. For patients with baseline renal impairment or increased risk of acute renal failure, monitor renal function weekly for the first month, then at least monthly. Reduce the starting dose in patients with preexisting renal disease. During therapy, increase the frequency of monitoring and modify the dose for patients with an increased risk of renal impairment, including use of concomitant nephrotoxic drugs, and pediatric patients with volume depletion or overchelation [see Dosage and Administration (2.1, 2.4, 2.5), Warnings and Precautions (5.1), Adverse Reactions (6.1, 6.2)].
Hepatic Failure
• Deferasirox can cause hepatic injury including hepatic failure and death.
• Measure serum transaminases and bilirubin in all patients prior to initiating treatment, every 2 weeks during the first month, and at least monthly thereafter.
• Avoid use of deferasirox in patients with severe (Child-Pugh C) hepatic impairment and reduce the dose in patients with moderate (Child-Pugh B) hepatic impairment [see Dosage and Administration (2.4), Warnings and Precautions (5.2)].
Gastrointestinal Hemorrhage
• Deferasirox can cause gastrointestinal (GI) hemorrhages, which may be fatal, especially in elderly patients who have advanced hematologic malignancies and/or low platelet counts.
• Monitor patients and discontinue deferasirox for suspected GI ulceration [see Warnings and Precautions (5.3)].

1 INDICATIONS AND USAGE
1.1 Treatment of Chronic Iron Overload Due to Blood Transfusions (Transfusional Iron Overload)
Deferasirox tablets for oral suspension are indicated for the treatment of chronic iron overload due to blood transfusions (transfusional hemosiderosis) in patients 2 years of age and older.
1.3 Limitations of Use
Controlled clinical trials of deferasirox with myelodysplastic syndromes (MDS) and chronic iron overload due to blood transfusions have not been performed [see Clinical Studies (14)].
The safety and efficacy of deferasirox when administered with other iron chelation therapy have not been established.
2 DOSE AND ADMINISTRATION
2.1 Transfusional Iron Overload
Deferasirox therapy should only be considered when a patient has evidence of chronic transfusional iron overload. The evidence should include the transfusion of at least 100 mL/kg of packed red blood cells (e.g., at least 20 units of packed red blood cells for a 40 kg person or more in individuals weighing more than 40 kg), and a serum ferritin consistently greater than 1000 mcg/L.
Prior to starting therapy or increasing dose, evaluate:
• Serum ferritin level
• Baseline renal function:
○ Obtain serum creatinine in duplicate (due to variations in measurements) to establish accurate baseline
○ Calculate the estimated glomerular filtration rate (eGFR). Use a prediction equation appropriate for adult patients (e.g., CKD-EPI, MDRD method) and in pediatric patients (e.g., Schwartz equations).
○ Obtain urinalyses and serum electrolytes to evaluate renal tubular function [see Dosage and Administration (2.4), Warnings and Precautions (5.1)].
• Serum transaminases and bilirubin [see Dosage and Administration (2.4), Warnings and Precautions (5.2)]
• Baseline auditory and ophthalmic examinations [see Warnings and Precautions (5.10)]

Initiating Therapy:
The recommended initial dose of deferasirox for patients 2 years of age and older with eGFR greater than 60 mL/min/1.73m² is 20 mg per kg body weight orally, once daily. Calculate doses (mg per kg per day) to the nearest whole tablet.
During Therapy:
• Monitor serum ferritin monthly and adjust the dose of deferasirox, if necessary, every 3 to 6 months based on serum ferritin trends.
• Use the minimum effective dose to achieve a trend of decreasing ferritin.
• Make dose adjustments in steps of 5 or 10 mg per kg and tailor adjustments to the individual patient's response and therapeutic goals.
• In patients not adequately controlled with doses of 30 mg per kg (e.g., serum ferritin levels persistently above 2,500 mcg/L and not showing a decreasing trend over time), doses of up to 40 mg per kg may be considered. Doses above 40 mg per kg are not recommended [see Warnings and Precautions (5.6)].
• Adjust dose based on serum ferritin levels:
○ If the serum ferritin falls below 1000 mcg/L at 2 consecutive visits, consider dose reduction, especially if the dose is greater than 25 mg/kg/day [see Adverse Reactions (6.1)].
○ If the serum ferritin falls below 500 mcg/L, interrupt deferasirox and continue monthly monitoring.
○ Evaluate the need for ongoing chelation therapy for patients whose conditions no longer require regular blood transfusions.
○ Use the minimum effective dose to maintain iron burden in the target range [see Warnings and Precautions (5.6)].
• Monitor blood counts, liver function, renal function and ferritin monthly [see Warnings and Precautions (5.1, 5.2, 5.4)].
• Interrupt deferasirox for pediatric patients who have acute illnesses which can cause volume depletion, such as vomiting, diarrhea, or prolonged decreased oral intake, and monitor more frequently. Resume therapy as appropriate, based on assessments of renal function, when oral intake and volume status are normal [see Dosage and Administration (2.4, 2.5), Warnings and Precautions (5.1), Use in Specific Populations (8.4), Clinical Pharmacology (12.3)].

----- **WARNINGS AND PRECAUTIONS** -----
• Acute Kidney Injury: Measure serum creatinine in duplicate before starting therapy. Monitor renal function during deferasirox therapy. Reduce dose or interrupt therapy for toxicity. (2.1, 2.4, 5.1)
• Hepatic Toxicity: Monitor hepatic function. Reduce dose or interrupt therapy for toxicity. (5.2)
• Fatal and Nonfatal Gastrointestinal Bleeding, Ulceration, and Irritation: Risk may be greater in patients who are taking deferasirox in combination with drugs that have known ulcerogenic or hemorrhagic potential. (5.3)
• Bone Marrow Suppression: Neutropenia, agranulocytosis, worsening anemia, and thrombocytopenia, including fatal events; monitor blood counts during deferasirox therapy. Interrupt therapy for toxicity. (5.4)
• Age-related Risk of Toxicity: Monitor elderly and pediatric patients closely for toxicity. (5.5)
• Hypersensitivity Reactions: Discontinue deferasirox for severe reactions and institute medical intervention. (5.7)
• Severe Skin Reactions including Stevens-Johnson Syndrome (SJS), toxic epidermal necrolysis (TEN) and Drug Reaction with Eosinophilia and Systemic Symptoms (DRESS): Discontinue deferasirox. (5.8)
----- **ADVERSE REACTIONS** -----
In patients with transfusional iron overload, the most frequently occurring (greater than 5%) adverse reactions are diarrhea, vomiting, nausea, abdominal pain, skin rashes, and increases in serum creatinine. (6.1)
To report SUSPECTED ADVERSE REACTIONS, contact Teva Pharmaceuticals USA, Inc. at 1-800-533-2872 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.
----- **DRUG INTERACTIONS** -----
• Avoid the use of deferasirox with aluminum-containing antacid preparations. (7.1)
• Deferasirox increases the exposure of the CYP2C8 substrate repaglinide. Consider repaglinide dose reduction and monitor blood glucose levels. (7.3)
• Avoid the use of deferasirox with CYP1A2 substrate theophylline. (7.4)
• Deferasirox increases exposure of busulfan. Monitor plasma concentration of busulfan when coadministered with deferasirox to allow dose adjustment of busulfan as needed. (7.7)
----- **USE IN SPECIFIC POPULATIONS** -----
• Pregnancy: Based on animal studies, may cause fetal harm. (8.1)
• Lactation: Advise women not to breastfeed. (8.2)
See 17 for PATIENT COUNSELING INFORMATION.

2.3 Administration
Do not chew tablets or swallow them whole.
Take deferasirox once daily on an empty stomach at least 30 minutes before food, preferably at the same time each day. Completely disperse tablets by stirring in water, orange juice, or apple juice until a fine suspension is obtained. Disperse doses less than 1 g in 3.5 ounces of liquid and doses of 1 g or greater in 7 ounces of liquid. After swallowing the suspension, resuspend an entire tablet in a small volume of liquid and swallow. Do not take deferasirox with aluminum-containing antacid products [see Drug Interactions (7.1)].
2.4 Use in Patients with Baseline Hepatic or Renal Impairment
Patients with Severe Hepatic Impairment
Mild (Child-Pugh A) Hepatic Impairment: No dose adjustment is necessary.
Moderate (Child-Pugh B) Hepatic Impairment: Reduce the starting dose by 50%.
Severe (Child-Pugh C) Hepatic Impairment: Avoid deferasirox [see Warnings and Precautions (5.2), Use in Specific Populations (8.7)].
Patients with Baseline Renal Impairment
Do not use deferasirox in adult or pediatric patients with eGFR less than 40 mL/min/1.73m² [see Dosage and Administration (2.5), Contraindications (4)].
For patients with renal impairment (eGFR 40 to 60 mL/min/1.73m²), reduce the starting dose by 50% [see Use in Specific Populations (8.6)].
Exercise caution in pediatric patients with eGFR between 40 and 60 mL/min/1.73m². If treatment is needed, use the minimum effective dose and monitor renal function frequently. Individualize dose titration based on improvement in renal injury [see Use in Specific Populations (8.6)].
2.5 Dose Modifications for Decreases in Renal Function while on Deferasirox
Deferasirox is contraindicated in patients with eGFR less than 40 mL/min/1.73 m² [see Contraindications (4)].
For decreases in renal function while receiving deferasirox [see Warnings and Precautions (5.1)], modify the dose as follows:
Transfusional Iron Overload
Adults:
• If the serum creatinine increases by 33% or more above the average baseline measurement, repeat the serum creatinine within 1 week, and if still elevated by 33% or more, reduce the dose by 10 mg per kg.
Pediatric Patients (ages 2 years to 17 years):
• Reduce the dose by 10 mg/kg/day if eGFR decreases by greater than 33% below the average baseline measurement and increase the dose to 20 mg/kg/day if eGFR within 100% of baseline.
• Interrupt deferasirox for acute illnesses which can cause volume depletion, such as vomiting, diarrhea, or prolonged decreased oral intake, and monitor more frequently. Resume therapy as appropriate, based on assessments of renal function, when oral intake and volume status are normal. Avoid use of other nephrotoxic drugs [see Warnings and Precautions (5.1)].
• In the setting of decreased renal function, evaluate the risk benefit profile of continued deferasirox use. Use the minimum effective deferasirox dose and monitor renal function more frequently, by evaluating tubular and glomerular function. Titrate dosing based on renal injury. Consider dose reduction or interruption and less nephrotoxic therapies until improvement of renal function. Signs of renal tubular or glomerular injury occur in the presence of other risk factors such as volume depletion, reduced or interrupted deferasirox to prevent severe and irreversible renal injury [see Warnings and Precautions (5.1)].

All Patients (regardless of age):
• Discontinue therapy for eGFR less than 40 mL/min/1.73m² [see Contraindications (4)].

2.6 Dose Modifications Based on Concomitant Medications
UDP-glucuronosyltransferases (UGT) Inducers
Concomitant use of UGT inducers decreases deferasirox systemic exposure. Avoid the concomitant use of potent UGT inducers (e.g., rifampicin, phenobarbital, rifonavi) with deferasirox. If you must administer deferasirox with 1 of these agents, consider increasing the initial dose of deferasirox by 50%, and monitor serum ferritin levels and clinical responses for further dose modification [see Dosage and Administration (2.1), Drug Interactions (7.5)].
Bile Acid Sequestrants
Concomitant use of bile acid sequestrants decreases deferasirox systemic exposure. Avoid the concomitant use of bile acid sequestrants (e.g., cholestyramine, colestevalem, colestipol) with deferasirox. If you must administer deferasirox with 1 of these agents, consider increasing the initial dose of deferasirox by 50%, and monitor serum ferritin levels and clinical responses for further dose modification [see Dosage and Administration (2.1), Drug Interactions (7.5)].

3 DOSE FORMS AND STRENGTHS
Deferasirox tablets, for oral suspension, are available as follows:
125 mg tablets
White to off-white, round, unscored tablets, debossed with  and 454 on one side and plain on the other side.
250 mg tablets
White to off-white, round, unscored tablets, debossed with  and 455 on one side and plain on the other side.
500 mg tablets
White to off-white, round, unscored tablets, debossed with  and 456 on one side and plain on the other side.
4 CONTRAINDICATIONS
Deferasirox is contraindicated in patients with:
• Estimated GFR less than 40 mL/min/1.73m² [see Dosage and Administration (2.5), Warnings and Precautions (5.1)].
• Poor performance status; [see Warnings and Precautions (5.1 and 5.3)]
• High-risk myelodysplastic syndromes; (this patient population was not studied and is not expected to benefit from chelation therapy)
• Advanced malignancies; [see Warnings and Precautions (5.1 and 5.3)]
• Platelet counts less than 50 x 10⁹/L; [see Warnings and Precautions (5.3 and 5.4)]
• Known hypersensitivity to deferasirox or any component of deferasirox [see Warnings and Precautions (5.7), Adverse Reactions (6.2)].

5 WARNINGS AND PRECAUTIONS
5.1 Acute Kidney Injury, Including Acute Renal Failure Requiring Dialysis, and Renal Tubular Toxicity Including Fanconi Syndrome
Deferasirox is contraindicated in patients with eGFR less than 40 mL/min/1.73m². Exercise caution in pediatric patients with eGFR between 40 and 60 mL/min/1.73 m². If treatment is needed, use the minimum effective dose and monitor renal function frequently. Individualize dose titration based on improvement in renal injury [see Use in Specific Populations (8.6)]. For patients with renal impairment (eGFR 40 to 60 mL/min/1.73m²), reduce the starting dose by 50% [see Dosage and Administration (2.4, 2.5), Use in Specific Populations (8.6)].
Deferasirox can cause acute kidney injury including renal failure requiring dialysis that has resulted in fatal outcomes. Based on postmarketing experience, most fatalities have occurred in patients with multiple comorbidities and who were in advanced stages of their hematological disorders. In the clinical trials, adult and pediatric deferasirox-treated patients with no preexisting renal disease experienced dose-dependent mild, non- progressive increases in serum creatinine and proteinuria. Preexisting renal disease and concomitant use of other nephrotoxic drugs may increase the risk of acute kidney injury in adult and pediatric patients. Acute illnesses associated with volume depletion and overchelation may increase the risk of acute kidney injury in pediatric patients. In pediatric patients, small decreases in eGFR can result in increases in deferasirox exposure, particularly in younger patients with body surface area typical of patients less than age 7 years. This can lead to a cycle of worsening renal injury and further increases in deferasirox exposure, unless the dose is reduced or interrupted. Renal tubular toxicity, including acute kidney injury, has been reported in patients treated with deferasirox, most commonly in pediatric patients with beta-thalassemia and serum ferritin levels less than 1,500 mcg/L [see Warnings and Precautions (5.6), Adverse Reactions (6.1, 6.2), Use in Specific Populations (8.4), Clinical Pharmacology (12.3)].
Evaluate renal glomerular and tubular function before initiating therapy or increasing the dose. Use prediction equations validated for use in adult and pediatric patients to estimate GFR. Obtain serum electrolytes and urinalysis in all patients to evaluate renal tubular function [see Dosage and Administration (2.1)].

Monitor all patients for changes in eGFR and for renal tubular toxicity weekly during the first month after initiation or modification of therapy and at least monthly thereafter. Monitor serum ferritin monthly to evaluate for overchelation. Use the minimum dose of deferasirox to achieve the target range. Monitor renal function more frequently in patients with preexisting renal disease or decreased renal function. In pediatric patients, interrupt deferasirox during acute illnesses which can cause volume depletion, such as vomiting, diarrhea, or prolonged decreased oral intake, and monitor renal function more frequently. Promptly correct fluid deficits to prevent renal injury. Resume therapy as appropriate, based on assessments of renal function, when oral intake and volume status are normal [see Dosage and Administration (2.5), Warnings and Precautions (5.6), Adverse Reactions (6.1, 6.2), Use in Specific Populations (8.4)].
5.2 Hepatic Toxicity and Failure
Deferasirox can cause hepatic injury, fatal in some patients. In Study 1, 4 patients (1.3%) discontinued deferasirox because of hepatic toxicity (drug-induced hepatitis in 2 patients and increased serum transaminases in 2 additional patients). Hepatic toxicity appears to be more common in patients greater than 55 years of age. Hepatic failure was more common in patients with significant comorbidities, including liver cirrhosis and multi-organ failure [see Adverse Reactions (6.1)]. Acute liver injury and failure, including fatal outcomes, have occurred in pediatric deferasirox-treated patients. Liver failure occurred in association with acute kidney injury in pediatric patients at risk for overchelation during a volume depleting event. Interrupt deferasirox therapy when acute liver injury or acute kidney injury is suspected and during volume depletion. Monitor liver and renal function more frequently in pediatric patients who are receiving deferasirox in the 20 to 40 mcg/kg/day range and when iron burden is approaching normal. Use the minimum effective dose to achieve and maintain a low iron burden [see Dosage and Administration (2.5), Warnings and Precautions (5.6), Adverse Reactions (6.1)].
Measure transaminases (AST and ALT) and bilirubin in all patients before the initiation of treatment, and every 2 weeks during the first month and at least monthly thereafter. Consider dose modifications or interruption of treatment for severe or persistent elevations.

Avoid the use of deferasirox in patients with severe (Child-Pugh C) hepatic impairment. Reduce the starting dose in patients with moderate (Child-Pugh B) hepatic impairment [see Dosage and Administration (2.4), Use in Specific Populations (8.7)]. Patients with mild (Child-Pugh A) or moderate (Child-Pugh B) hepatic impairment may be at higher risk for hepatic toxicity.
5.3 Gastrointestinal (GI) Ulceration, Hemorrhage, and Perforation
GI hemorrhage, including deaths, has been reported in deferasirox-treated patients, especially in elderly patients who had advanced hematologic malignancies and/or low platelet counts. Nonfatal upper GI irritation, ulceration and hemorrhage have been reported in patients, including children and adolescents, receiving deferasirox [see Adverse Reactions (6.1)]. Monitor for signs and symptoms of GI ulceration and hemorrhage during deferasirox therapy and promptly initiate additional evaluation and treatment if a serious GI adverse event is suspected. The risk of gastrointestinal hemorrhage may be increased when administering deferasirox in combination with drugs that have ulcerogenic or hemorrhagic potential, such as nonsteroidal anti-inflammatory drugs (NSAIDs), corticosteroids, oral bisphosphonates, or anticoagulants. There have been reports of ulcers complicated with gastrointestinal perforation (including fatal outcome) [see Adverse Reactions (6.2)].
5.4 Bone Marrow Suppression
Neutropenia, agranulocytosis, worsening anemia, and thrombocytopenia, including fatal events, have been reported in patients treated with deferasirox. Preexisting hematologic disorders may increase this risk. Monitor blood counts in all patients. Interrupt treatment with deferasirox in patients who develop cytopenias until the cause of the cytopenia has been determined. Deferasirox is contraindicated in patients with platelet counts below 50 x 10⁹/L.
5.5 Age-Related Risk of Toxicity
Elderly Patients
Deferasirox is being associated with serious and fatal adverse reactions in the postmarketing setting among adults, predominantly in elderly patients. Monitor elderly patients treated with deferasirox more frequently for toxicity [see Use in Specific Populations (8.5)].
Pediatric Patients
Deferasirox has been associated with serious and fatal adverse reactions in pediatric patients in the postmarketing setting. These events were frequently associated with volume depletion or with continued deferasirox doses in the 20 to 40 mcg/kg/day range. Interrupt deferasirox in pediatric patients with volume depletion, and resume deferasirox when renal function and fluid volume have normalized. Monitor liver and renal function more frequently during volume depletion and in patients receiving deferasirox in the 20 to 40 mcg/kg/day range when iron burden is approaching the normal range. Use the minimum effective dose to achieve and maintain a low iron burden [see Dosage and Administration (2.4), Warnings and Precautions (5.6), Use in Specific Populations (8.4)].
5.6 Overchelation
For patients with transfusional iron overload, measure serum ferritin monthly to assess for possible overchelation of iron. In a study of elderly patients treated with deferasirox in pooled clinical trials (n=158) found a higher rate of renal adverse events among patients receiving doses greater than 25 mg/kg/day while their serum ferritin values were less than 1,000 mcg/L. Consider dose reduction or closer monitoring of renal and hepatic function, and serum ferritin levels during these periods. Use the minimum effective dose to maintain a low-iron burden [see Adverse Reactions (6.1), Use in Specific Populations (8.4)].
If the serum ferritin falls below 1000 mcg/L at 2 consecutive visits, consider dose reduction, especially if the dose is greater than 25 mg/kg/day [see Adverse Reactions (6.1)]. If the serum ferritin falls below 500 mcg/L, interrupt therapy with deferasirox and continue monthly monitoring. Evaluate the need for ongoing chelation for patients whose conditions do not require regular blood transfusions. Use the minimum effective dose to maintain iron burden in the target range. Continued administration of deferasirox in the 20 to 40 mcg/kg/day range when the body iron burden is approaching or within the normal range has resulted in life-threatening adverse events [see Dosage and Administration (2.1)].

5.7 Hypersensitivity
Deferasirox may cause serious hypersensitivity reactions (such as anaphylaxis and angioedema), with the onset of the reaction occurring within the first month of treatment [see Adverse Reactions (6.2)]. If reactions are severe, discontinue deferasirox and institute appropriate medical intervention. Deferasirox is contraindicated in patients with known hypersensitivity to deferasirox products and should not be reintroduced in patients who have experienced previous hypersensitivity reactions on deferasirox products due to the risk of anaphylactic shock.

5.8 Severe Skin Reactions
Severe cutaneous adverse reactions (SCARs) including Stevens-Johnson syndrome (SJS), toxic epidermal necrolysis (TEN), and drug reaction with eosinophilia and systemic symptoms (DRESS) which could be life-threatening or fatal have been reported during deferasirox therapy [see Adverse Reactions (6.1, 6.2)]. Cases of iridema multiforme have not been observed. Advise patients of the signs and symptoms of severe skin reactions, and closely monitor. If any severe skin reactions are suspected, discontinue deferasirox immediately and do not reintroduce deferasirox therapy.
5.9 Skin Rash
Rashes may occur during deferasirox treatment [see Adverse Reactions (6.1)]. For rashes of mild to moderate severity, deferasirox may be continued without dose adjustment, since the rash often resolves spontaneously. In severe cases, interrupt treatment with deferasirox. Reintroduction at a lower dose with escalation may be considered after resolution of the rash.
5.10 Auditory and Ocular Abnormalities
Auditory disturbances (high frequency hearing loss, decreased hearing), and ocular disturbances (lens opacities, cataracts, elevations in intraocular pressure, and retinal disorders) were reported at a frequency of less than 1% with deferasirox therapy in the clinical studies. The frequency of auditory adverse events irrespective of causality was increased among pediatric patients who received deferasirox doses greater than 25 mg/kg/day when serum ferritin was less than 1,000 mcg/L [see Warnings and Precautions (5.6)]. Perform auditory and ophthalmic testing (including slit lamp examinations and dilated funduscopy) before starting deferasirox treatment and thereafter at regular intervals (every 12 months). If disturbances are noted, monitor more frequently. Consider dose reduction or interruption.
6 ADVERSE REACTIONS
The following clinically significant adverse reactions are also discussed in other sections of the labeling:
• Acute Kidney Injury, Including Acute Renal Failure Requiring Dialysis, and Renal Tubular Toxicity Including Fanconi Syndrome [see Warnings and Precautions (5.1)]
• Hepatic Toxicity and Failure [see Warnings and Precautions (5.2)]
• Gastrointestinal (GI) Hemorrhage [see Warnings and Precautions (5.3)]
• Bone Marrow Suppression [see Warnings and Precautions (5.4)]
• Hypersensitivity [see Warnings and Precautions (5.7)]
• Severe Skin Reactions [see Warnings and Precautions (5.8)]
• Skin Rash [see Warnings and Precautions (5.9)]
• Auditory and Ocular Abnormalities [see Warnings and Precautions (5.10)]

6.1 Clinical Trials Experience
Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.
Transfusional Iron Overload
A total of 700 adult and pediatric patients were treated with deferasirox for 48 weeks in premarketing studies. These included 468 patients with beta-thalassemia, 99 with rare anemias, and 132 with sickle cell disease. Of these patients, 45% were male, 70% were Caucasian and 292 patients were less than 16 years of age. In the sickle cell disease population, 89% of patients were black. Median treatment duration among the sickle cell patients was 51 weeks. Of the 700 patients treated, 469 (403 beta-thalassemia and 66 rare anemia) were entered into extensions of the original clinical protocols. In ongoing extension studies, median durations of treatment were 88 to 205 weeks.
Six hundred twenty-seven (627) patients with MDS were enrolled across 5 uncontrolled trials. These studies varied in duration from 1 to 5 years. The discontinuation rate across studies in the first year was 46% (AeS 20%, withdrawal of consent 10%, death 8%, other 4%, lab abnormalities 3%, and lack of efficacy 1%). Among 47 patients enrolled in the study of 5-year duration, 10 remained on deferasirox at the completion of the study.
Table 1 displays adverse reactions occurring in greater than 5% of deferasirox-treated beta-thalassemia patients (Study 1), sickle cell disease patients (Study 3), and patients with MDS pooled. Adverse reactions that led to discontinuations included abnormal gastrointestinal symptoms, increases in serum creatinine, and skin rash were dose related.

Table 1. Adverse Reactions* Occurring in Greater Than 5% of Deferasirox-Treated Patients in Study 1, Study 3, and MDS Pool

Adverse Reactions	Study 1 (Beta-thalassemia)		Study 3 (Sickle Cell Disease)		MDS Pool	
	N=296 n (%)	N=290 n (%)	N=132 n (%)	N=63 n (%)	N=627 n (%)	N=627 n (%)
Abdominal Pain**	63 (21)	51 (14)	37 (28)	9 (14)	145 (23)	145 (23)
Diarrhea	35 (12)	21 (7)	26 (20)	3 (5)	297 (47)	297 (47)
Creatinine Increased***	33 (11)	0 (0)	9 (7)	0	89 (14)	89 (14)
Nausea	31 (11)	14 (5)	30 (23)	7 (11)	161 (26)	161 (26)

*Adverse reaction frequencies are based on adverse events reported regardless of relationship to study drug.
**Includes 'abdominal pain,' 'abdominal pain lower,' and 'abdominal pain upper' which were reported as adverse events.
***Includes 'blood creatinine increased' and 'blood creatinine abnormal' which were reported as adverse events. See also Table 2.
In Study 1, a total of 113 (38%) patients treated with deferasirox had increases in serum creatinine greater than 33% above baseline on 2 separate occasions (Table 2) and 25 (8%) patients required dose reductions. Increases in serum creatinine appeared to be dose related [see Warnings and Precautions (5.1)]. In this study, 17 (6%) patients treated with deferasirox developed elevations in SGPT/ALT levels greater than 5 times the ULN at 2 consecutive visits. Of these, 2 patients had liver biopsy proven drug-induced hepatitis and both discontinued deferasirox therapy [see Warnings and Precautions (5.2)]. An additional 2 patients, who did not have elevations in SGPT/ALT greater than 5 times the ULN, discontinued deferasirox because of increased SGPT/ALT. Increases in transaminases did not appear related to the dose of deferasirox. Four additional patients discontinued deferasirox due to adverse reactions with a suspected relationship to study drug, including diarrhea, pancreatitis associated with gallstones, atypical tuberculosis, and skin rash.

In Study 3, a total of 48 (36%) patients treated with deferasirox had increases in serum creatinine greater than 33% above baseline on 2 separate occasions (Table 2) [see Warnings and Precautions (5.1)]. Of the patients who experienced creatinine increases in Study 3, 8 deferasirox-treated patients required dose reductions. In this study, 5 patients in the deferasirox group had elevations in SGPT/ALT levels greater than 5 times the ULN at 2 consecutive visits and 1 patient subsequently had deferasirox permanently discontinued. Four additional patients discontinued deferasirox due to adverse reactions with a suspected relationship to study drug, including diarrhea, pancreatitis associated with gallstones, atypical tuberculosis, and skin rash.
In the MDS pool, in the first year, a total of 229 (37%) patients treated with deferasirox had increases in serum creatinine greater than 33% above baseline on 2 consecutive occasions (Table 2) and (8.3%) patients permanently discontinued [see Warnings and Precautions (5.1)]. A total of 5 (0.8%) patients developed SGPT/ALT levels greater than 5 times the ULN at 2 consecutive visits. The most frequent adverse reactions that led to discontinuation included increases in serum creatinine, diarrhea, nausea, and vomiting. Death was reported in the first year in 52 (8%) of patients [see Clinical Studies (14)].

Table 2. Number (%) of Patients with Increases in Serum Creatinine or SGPT/ALT in Study 1, Study 3, and MDS Pool

Laboratory Parameter	Study 1 (Beta-thalassemia)		Study 3 (Sickle Cell Disease)		MDS Pool	
	N=296 n (%)	N=290 n (%)	N=132 n (%)	N=63 n (%)	N=627 n (%)	N=627 n (%)
Serum Creatinine						
Creatinine increase >33% at 2 consecutive post-baseline visits	113 (38)	41 (14)	48 (36)	14 (22)	229 (37)	229 (37)
Creatinine increase >33% and >ULN at 2 consecutive post-baseline visits	7 (2)	1 (0)	3 (2)	2 (3)	126 (20)	126 (20)
SGPT/ALT						
SGPT/ALT >5 x ULN at 2 post-baseline visits	25 (8)	7 (2)	2 (2)	0	9 (1)	9 (1)
SGPT/ALT >5 x ULN at 2 consecutive post-baseline visits	17 (6)	5 (2)	5 (4)	0	5 (1)	5 (1)

Proteinuria
In clinical studies, urine protein was measured monthly. Intermittent proteinuria (urine protein/creatinine ratio greater than 0.6 mg/mg) occurred in 18.6% of deferasirox-treated patients compared to 7.2% of deferaxamine-treated patients in Study 1 [see Warnings and Precautions (5.1)].
Other Adverse Reactions
In the population of more than 5,000 patients with transfusional iron overload who have been treated with deferasirox during clinical trials, adverse reactions occurring in 0.1% to 1% of patients included gastritis, edema, severe disorder, pigmentation disorder, dizziness, anxiety, maculopathy, cholelithiasis, pyrexia, fatigue, laryngeal pain, cataract, hearing loss, gastrointestinal hemorrhage, gastric ulcer (including multiple ulcers), duodenal ulcer, renal tubular disorder (Fanconi Syndrome), and acute pancreatitis (with and without underlying biliary conditions). Adverse reactions occurring in 0.01% to 0.1% of patients included optic neuritis, esophagitis, erythema multiforme, and drug reaction with eosinophilia and systemic symptoms (DRESS). Adverse reactions which most frequently led to dose interruption or dose adjustment during clinical trials were rash, gastrointestinal hemorrhage, dizziness, anxiety, increased serum creatinine, and increased serum transaminases.

Pooled Analysis of Pediatric Clinical Trial Data
A nested case control analysis was conducted within a deferasirox pediatric pooled clinical trial dataset to evaluate the effects of dose and serum ferritin level, separately and combined, on kidney function. Among 1213 children (aged 2 to 15 years) with transfusion-dependent thalassemia, 162 cases of acute kidney injury (eGFR <90 mL/min/1.73m²) and 621 matched-controls with normal kidney function (eGFR ≥120 mL/min/1.73m²) were identified. The primary findings were:
- A 26% increased risk of acute kidney injury was observed with each 5 mg/kg increase in daily deferasirox dose starting at 20 mg/kg/day (95%CI: 1.08 to 1.48).
- A 25% increased risk for acute kidney injury was observed with each 250 mcg/L decrease in serum ferritin starting at 1250 mcg/L (95%CI: 1.01 to 1.56).
- Among pediatric patients with

Rifampicin: In a healthy volunteer study, the concomitant administration of deferasirox (single dose of 30 mg per kg) and the potent UDP-glucuronosyltransferase (UGT) inducer rifampicin (600 mg/day for 9 days) resulted in a decrease of deferasirox systemic exposure (AUC) by 44%. *[see Drug Interactions (7.5)].*

Cholestyramine: The concomitant use of deferasirox with bile acid sequestrants may result in a decrease in deferasirox efficacy. In healthy volunteers, the administration of cholestyramine after a single dose of deferasirox resulted in a 45% decrease in deferasirox exposure (AUC). *[see Drug Interactions (7.6)].*

Busulfan: Concomitant administration of deferasirox and busulfan resulted in an increase of busulfan exposure (AUC).

In vitro Studies:

- **Cytochrome P450 Enzymes:** Deferasirox inhibits human CYP3A4, CYP2C8, CYP1A2, CYP2A6, CYP2D6, and CYP2C19 *in vitro*.
- **Transporter Systems:** The addition of cyclosporin A (PgP/MRP1/MRP2 inhibitor) or verapamil (PgP/MRP1 inhibitor) did not influence ICL670 permeability *in vitro*.

Pharmacokinetics in Specific Populations

Pediatric: Following oral administration of single or multiple doses, systemic exposure of adolescents and children to deferasirox was less than in adult patients. In children less than 6 years of age, systemic exposure was about 50% lower than in adults.

Geriatric: The pharmacokinetics of deferasirox have not been studied in elderly patients (65 years of age or older).

Gender: Females have a moderately lower apparent clearance (by 17.5%) for deferasirox compared to males.

Renal Impairment: Compared to patients with MDS and eGFR greater than 60 mL/min/1.73m², patients with MDS and eGFR 40 to 60 mL/min/1.73m² (n=34) had approximately 50% higher mean deferasirox trough plasma concentrations.

Hepatic Impairment: In a single dose (20 mg/kg) study in patients with varying degrees of hepatic impairment, deferasirox exposure was increased compared to patients with normal hepatic function. The average total (free and bound) AUC of deferasirox increased 16% in 6 patients with mild (Child-Pugh A) hepatic impairment, and 76% in 6 patients with moderate (Child-Pugh B) hepatic impairment compared to 6 patients with normal hepatic function. The impact of severe (Child-Pugh C) hepatic impairment was assessed in only 1 patient.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

A 104-week oral carcinogenicity study in Wistar rats showed no evidence of carcinogenicity from deferasirox at doses up to 60 mg per kg per day (0.48 times the MRHD on an mg/m² basis). A 26-week oral carcinogenicity study in p53 (+/-) transgenic mice has shown no evidence of carcinogenicity from deferasirox at doses up to 200 mg per kg per day (0.81 times the MRHD on an mg/m² basis) in males and 300 mg per kg per day (1.21 times the MRHD on a mg/m² basis) in females.

Deferasirox was negative in the Ames test and chromosome aberration test with human peripheral blood lymphocytes. It was positive in 1 of 3 *in vivo* oral rat micronucleus tests.

Deferasirox at oral doses up to 75 mg per kg per day (0.6 times the MRHD on an mg/m² basis) was found to have no adverse effect on fertility and reproductive performance of male and female rats.

14 CLINICAL STUDIES

Transfusional Iron Overload

The primary efficacy study, Study 1 (NCT00061750), was a multicenter, open-label, randomized, active-comparator control study to compare deferasirox and deferoxamine in patients with beta-thalassemia and transfusional hemosiderosis. Patients greater than or equal to 2 years of age were randomized in a 1:1 ratio to receive either oral deferasirox at starting doses of 5, 10, 20, or 30 mg per kg once daily or subcutaneous Desferal (deferoxamine) at starting doses of 20 to 60 mg per kg for at least 5 days per week based on LIC at baseline (2 to 3, greater than 3 to 7, greater than 7 to 14, and greater than 14 mg Fe/g dry weight). Patients randomized to deferoxamine who had LIC values less than 7 mg Fe/g dry weight were permitted to continue on their prior deferoxamine dose, even though the dose may have been higher than specified in the protocol.

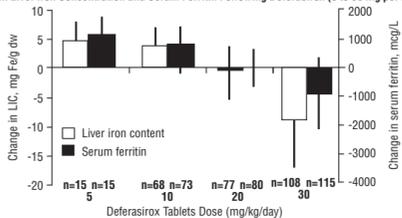

Patients were to have a liver biopsy at baseline and end of study (after 12 months) for LIC. The primary efficacy endpoint was defined as a reduction in LIC of greater than or equal to 3 mg Fe/g dry weight for baseline values greater than or equal to 10 mg Fe/g dry weight, reduction of baseline values between 7 and less than 10 to less than 7 mg Fe/g dry weight, or maintenance or reduction for baseline values less than 7 mg Fe/g dry weight.

A total of 586 patients were randomized and treated, 296 with deferasirox and 290 with deferoxamine. The mean age was 17.1 years (range, 2 to 53 years); 52% were females and 88% were Caucasian. The primary efficacy population consisted of 553 patients (deferasirox n=276; deferoxamine n=277) who had LIC evaluated at baseline and 12 months or discontinued due to an adverse event. The percentage of patients achieving the primary endpoint was 52.9% for deferasirox and 66.4% for deferoxamine. The relative efficacy of deferasirox to deferoxamine cannot be determined from this study.

In patients who had an LIC at baseline and at end of study, the mean change in LIC was -2.4 mg Fe/g dry weight in patients treated with deferasirox and -2.9 mg Fe/g dry weight in patients treated with deferoxamine.

Reduction of LIC and serum ferritin was observed with deferasirox doses of 20 to 30 mg per kg per day. Deferasirox doses below 20 mg per kg per day failed to provide consistent lowering of LIC and serum ferritin levels (Figure 1). Therefore, a starting dose of 20 mg per kg per day is recommended *[see Dosage and Administration (2.1)]*.

Figure 1. Changes in Liver Iron Concentration and Serum Ferritin Following Deferasirox (5 to 30 mg per kg per day) in Study 1

Study 2 (NCT00061763) was an open-label, noncomparative trial of efficacy and safety of deferasirox given for 1 year to patients with chronic anemias and transfusional hemosiderosis. Similar to Study 1, patients received 5, 10, 20, or 30 mg per kg per day of deferasirox based on baseline LIC.

A total of 184 patients were treated in this study: 85 patients with beta-thalassemia and 99 patients with other congenital or acquired anemias (myelodysplastic syndromes, n=47; Diamond-Blackfan syndrome, n=30; other, n=22). Nineteen percent of patients were less than 16 years of age and 16% were greater than 65 years of age. There was a reduction in the absolute LIC from baseline to end of study (-4.2 mg Fe/g dry weight).

Study 3 (NCT00067080) was a multicenter, open-label, randomized trial of the safety and efficacy of deferasirox relative to deferoxamine given for 1 year in patients with sickle cell disease and transfusional hemosiderosis. Patients were randomized to deferasirox at doses of 5, 10, 20, or 30 mg per kg per day or subcutaneous deferoxamine at doses of 20 to 60 mg per kg per day for 5 days per week according to baseline LIC.

A total of 195 patients were treated in this study; 132 with deferasirox and 63 with deferoxamine. Forty-four percent (44%) of patients were less than 16 years of age and 91% were black. At end of study, the mean change in LIC (as measured by magnetic susceptibility by a superconducting quantum interference device) in the per protocol-1 (PP-1) population, which consisted of patients who had at least 1 post-baseline LIC assessment, was -1.3 mg Fe/g dry weight for patients receiving deferasirox (n=113) and -0.7 mg Fe/g dry weight for patients receiving deferoxamine (n=54).

One-hundred five (105) patients with thalassemia major and cardiac iron overload were enrolled in a study assessing the change in cardiac MRI T2* value (measured in milliseconds, ms) before and after treatment with deferasirox. Cardiac T2* values at baseline ranged from 5 to less than 20 ms. The geometric mean of cardiac T2* in the 68 patients who completed 3 years of deferasirox therapy increased from 11.98 ms at baseline to 17.12 ms at 3 years. Cardiac T2* values improved in patients with severe cardiac iron overload (less than 10 ms) and in those with mild to moderate cardiac iron overload (greater than or equal to 10 to less than 20 ms). The clinical significance of these observations is unknown.

Six hundred twenty-seven (627) patients with MDS were enrolled across 5 uncontrolled trials. Two hundred thirty-nine (239) of the 627 patients were enrolled in trials that limited enrollment to patients with IPSS Low or Intermediate 1 risk MDS, and the remaining 388 patients were enrolled in trials that did not specify MDS risk stratification but required a life expectancy of greater than 1 year. Planned duration of treatment in these trials ranged from 1 year (365 patients) to 5 years (47 patients). These trials evaluated the effects of deferasirox therapy on parameters of iron overload, including LIC (125 patients) and serum ferritin (627 patients). The percent of patients completing planned duration of treatment was 51% in the largest 1 year study, 52% in the 3-year study and 22% in the 5-year study. The major causes for treatment discontinuation were withdrawal of consent, adverse reaction, and death. Over 1-year of follow-up across these pooled studies, mean change in serum ferritin was -332.8 (±2615.59) mcg/L (n=593) and mean change in LIC was -5.9 (±8.32) mg Fe/g dw (n=68). Results of these pooled studies in 627 patients with MDS suggest a progressive decrease in serum ferritin and LIC beyond 1 year in those patients who are able to continue deferasirox. No controlled trials have been performed to demonstrate that these reductions improve morbidity or mortality in patients with MDS. Adverse reactions with deferasirox therapy occur more frequently in older patients. *[see Use in Specific Populations (8.5)].* In elderly patients, including those with MDS, individualize the decision to remove accumulated iron based on clinical circumstances and the anticipated clinical benefit and risks of deferasirox therapy.

16 HOW SUPPLIED/STORAGE AND HANDLING

Deferasirox is provided as 125 mg, 250 mg and 500 mg Tablets For Oral Suspension.

125 mg – White to off-white, round, unscored tablets, debossed with  and 454 on one side and plain on the other side. Tablets are supplied in bottles of 30 (NDC 45963-454-30) with a child-resistant closure.

250 mg – White to off-white, round, unscored tablets, debossed with  and 455 on one side and plain on the other side. Tablets are supplied in bottles of 30 (NDC 45963-455-30) with a child-resistant closure.

500 mg – White to off-white, round, unscored tablets, debossed with  and 456 on one side and plain on the other side. Tablets are supplied in bottles of 30 (NDC 45963-456-30) with a child-resistant closure.

Store at 25°C (77°F); excursions are permitted to 15 to 30°C (59 to 86°F) *[see USP Controlled Room Temperature]*. Protect from moisture.

Dispense in a tight, light-resistant container as defined in the USP.

KEEP THIS AND ALL MEDICATIONS OUT OF THE REACH OF CHILDREN.

17 PATIENT COUNSELING INFORMATION

Dosing Instructions

Advise patients to take deferasirox tablet once daily on an empty stomach at least 30 minutes prior to food, preferably at the same time every day. Instruct patients to completely disperse the tablets in water, orange juice, or apple juice, and drink the resulting suspension immediately. After the suspension has been swallowed, resuspend any residue in a small volume of the liquid and swallow *[see Dosage and Administration (2.3)]*.

Advise patients not to chew tablets or swallow them whole *[see Dosage and Administration (2.3)]*.

Blood Testing

Advise patients that blood tests will be performed frequently to check for damage to kidneys, liver, or blood cells *[see Warnings and Precautions (5.1, 5.2, 5.3, 5.4, 5.5)]*.

Gastrointestinal Ulceration and Hemorrhage

Caution patients about the potential for the development of GI ulcers or bleeding when taking deferasirox in combination with drugs that have ulcerogenic or hemorrhagic potential, such as NSAIDs, corticosteroids, oral bisphosphonates, or anticoagulants. Advise patients to contact their health care provider for signs and symptoms of gastrointestinal ulceration and hemorrhage *[see Warnings and Precautions (5.3)]*.

Allergic Reactions

Serious allergic reactions (which include swelling of the throat) have been reported in patients taking deferasirox, usually within the first month of treatment. If reactions are severe, advise patients to stop taking deferasirox immediately and seek immediate medical attention *[see Warnings and Precautions (5.7, 5.8)]*.

Skin Rash

Skin rashes may occur during deferasirox treatment. If the skin rash is severe, advise patients to stop taking deferasirox and seek medical attention *[see Warnings and Precautions (5.9)]*.

Pediatric Patients with Acute Illness

Instruct pediatric patients and their caregivers to contact their healthcare provider during episodes of acute illness, especially if the patient has not been drinking fluids or the patient has volume depletion due to fever, vomiting, or diarrhea *[see Warnings and Precautions (5.1)]*.

Auditory and Ocular Testing

Because auditory and ocular disturbances have been reported with deferasirox, conduct auditory testing and ophthalmic testing before starting deferasirox treatment and thereafter at regular intervals. Advise patients to contact their healthcare provider if they develop visual or auditory changes during treatment *[see Warnings and Precautions (5.10)]*.

Drug Interactions

Caution patients not to take aluminum-containing antacids and deferasirox simultaneously *[see Drug Interactions (7.1)]*.

Caution patients about potential loss of effectiveness of drugs metabolized by CYP3A4 (e.g., cyclosporine, simvastatin, hormonal contraceptive agents) when deferasirox is administered with these drugs *[see Drug Interactions (7.2)]*.

Caution patients about potential loss of effectiveness of deferasirox when administered with drugs that are potent UGT inducers (e.g., rifampicin, phenytoin, phenobarbital, ritonavir). Based on serum ferritin levels and clinical response, consider increases in the dose of deferasirox when concomitantly used with potent UGT inducers *[see Drug Interactions (7.5)]*.

Caution patients about potential loss of effectiveness of deferasirox when administered with drugs that are bile acid sequestrants (e.g., cholestyramine, colestevlam, colestipol). Based on serum ferritin levels and clinical response, consider increases in the dose of deferasirox when concomitantly used with bile acid sequestrants *[see Drug Interactions (7.6)]*.

Caution patients with diabetes to monitor their glucose levels more frequently when repaglinide is used concomitantly with deferasirox *[see Drug Interactions (7.3)]*.

Driving and Using Machinery

Caution patients experiencing dizziness to avoid driving or operating machinery *[see Adverse Reactions (6.1)]*.
